What is claimed is:

- 1. In a method of operating a vacuum corrugated belt feeder with positive air pressure separator during a feed cycle wherein said vacuum and said positive pressure air are controlled by a vacuum valve and a positive air pressure valve respectively, wherein the paper is taken away by a belt which is activated when a feed clutch is energized, wherein the vacuum is actuated at the start of the feed cycle and de-actuated when the feed clutch is de-energized, the improvement comprising:
- pulsing the positive air pressure separator by actuating and de-actuating said positive air pressure separator during the feed cycle.
- 2. The method of claim 1 wherein said positive air pressure separator is actuated when said vacuum is actuated, and said positive air pressure is deactuated before the feed clutch is energized.
- 3. The method of claim 1 when the feed rate is 110 pages per minute, wherein said positive air pressure separator is actuated when said vacuum is actuated, and said positive air pressure is de-actuated approximately 50 milliseconds before the feed clutch is energized.
- 4. The method of claim 1 when the feed rate is 110 pages per minute, wherein said positive air pressure valve is closed approximately 50 milliseconds prior to the clutch being energized.
- 5. A method of operating a vacuum corrugated belt feeder with positive air pressure separator during a feed cycle wherein said vacuum and said positive pressure air are controlled by a vacuum valve and a positive air pressure valve respectively, wherein the paper is taken away by a belt which is activated when a feed clutch is energized, comprising:
 - opening said vacuum valve and said positive pressure air valve; closing said positive pressure air valve; energizing the feed clutch on the belt feeder;
- de-energizing the feed clutch; and, closing said vacuum valve.
